

Yahyaz Lab Website

Project handoff PDF for continuing development in a new ChatGPT chat. Generated for the local project at C:\Users\ThaherTech\Documents\New project 3.

Field	Current value
Brand	Yahyaz Lab
Site purpose	Single-page portfolio for an individual game studio
Featured games	White Ninja; Puzzle VS Zombie
Contact email	admin@yahyazlab.com
GitHub remote	https://github.com/CryptoWolf77/Yahyaz-Lab-Website.git
Branch	main tracking origin/main
Latest known commit	d6d4903 Optimize website images

Important: this document is meant to be pasted or uploaded into a fresh ChatGPT conversation. It summarizes the architecture, assets, decisions, known fixes, and safe next steps.

1. Project Snapshot

- Frontend stack: Vite + React + TypeScript, with Three.js for the hero scene and lucide-react for icons.
- No router is used. The site is one scrolling page with anchor navigation: top, showreel, games, studio, contact.
- Design direction: premium dark cinematic arcade/lab UI with cyan, pink, gold, white, and horror-green accents.
- The hero is intentionally 3D-like: it uses the real Yahyaz Lab transparent logo plus a Three.js floating media scene in the background.
- The main content data is centralized in src/data/siteContent.ts. Game copy, asset paths, videos, screenshots, store placeholders, and hero images are defined there.
- Arabic language support exists, but the overall website layout must stay left-to-right. Arabic changes text only, not page geometry.

Run Commands

Use npm.cmd in PowerShell because npm.ps1 can be blocked by local execution policy.

```
npm.cmd install
npm.cmd run dev
npm.cmd run build
npm.cmd run preview
```

Dev server target: http://127.0.0.1:5173/. Preview target: http://127.0.0.1:4173/.

2. Main File Map

Path	Purpose
index.html	Vite entry HTML, favicon reference, meta description, preloads hero logo.
src/main.tsx	React root mounting entry.
src/App.tsx	Main UI, translation state, language switcher, video panels, game cards, modal, sections.
src/components/HeroScene.tsx	Three.js WebGL hero background with floating logo/screenshots, particles, grid, reduced-motion handling, WebGL fallback.
src/data/siteContent.ts	Structured studio and games content, asset paths, screenshots, trailers, store placeholder buttons.
src/styles.css	Full visual system, responsive layout, hero logo 3D treatment, header, language switcher, cards, modal, reduced-motion rules.
public/assets/	Optimized public media: WebP images and MP4 videos used directly by Vite public paths.
public/favicon.ico	Browser tab icon generated from the Yahyaz Lab logo.
dist/	Build output. Do not edit directly.

3. Current Features

- Fixed glass-style top navigation with logo, anchor links, and EN/Arabic language switcher.
- Hero section with 3D Yahyaz Lab logo presentation, Since 2021 badge, studio tagline, and CTA buttons.
- Lazy-loaded Three.js hero scene via React lazy/Suspense to avoid loading the WebGL code before the app shell.
- Showreel section with three videos: studio identity reel, White Ninja promo, Puzzle VS Zombie promo.

- Game showcase section for White Ninja and Puzzle VS Zombie with screenshot galleries, trailers, genre tags, and disabled store buttons until real URLs are provided.
- Game detail modal with larger gallery, keyboard support for Escape/arrow keys, feature list, and placeholder store buttons.
- Studio identity section with logo, Since 2021 marker, intro copy, and three metrics.
- Contact CTA uses mailto:admin@yahyazlab.com.
- Responsive mobile layout with careful sizing to prevent the hero logo/header from clipping.
- Images are lazy-loaded where appropriate and use decoding=async; hero logo is eager with fetchPriority=high.
- Videos use preload=metadata and autoplay only when featured/in view or on hover, keeping first load lighter.

4. Assets

Assets were copied into public/assets and optimized. Image references now point to WebP files. Keep public paths stable because content uses absolute public URLs like /assets/brand/logo-transparent.webp.

Category	Files
Brand	brand/logo-transparent.webp, brand/logo-square.webp, brand/logo-bg.webp
White Ninja	white-ninja/icon.webp; white-ninja/screen-1.webp through screen-7.webp; videos/white-ninja-promo.mp4
Puzzle VS Zombie	puzzle-vs-zombie/featured.webp, feature-graphics.webp, screen-1.webp through screen-6.webp; videos/puzzle-vs-zombie-promo.mp4
Studio video	videos/yahyaz-blackbg.mp4
Favicon	public/favicon.ico

Largest Known Media Files

File	Approx size	Note
public/assets/videos/white-ninja-promo.mp4	49.6 MB	Largest remaining file, below GitHub 100 MB limit.
public/assets/videos/puzzle-vs-zombie-promo.mp4	6.8 MB	Compressed from over 100 MB to fix GitHub push error.
public/assets/videos/yahyaz-blackbg.mp4	1.6 MB	Studio identity reel.

5. Content Model

src/data/siteContent.ts exports a Game type, a studio object, a games array, and heroImages. Most future content edits should begin here instead of changing UI components.

Object	Fields / behavior
studio	name, tagline, intro, logoTransparent, logoSquare, showreel
games[]	id, title, kicker, description, longDescription, theme, icon, featured, trailer, poster, screenshots, tags, features, stores
stores[]	label and optional href. Buttons are disabled when href is missing.
heroImages	Images loaded into the Three.js hero scene as floating planes.

If real App Store or Google Play links are later provided, add href values to each game store object. Then update the UI if buttons should become anchor links instead of disabled buttons.

6. Language And Arabic Notes

- Language state is defined in src/App.tsx as type Language = 'en' | 'ar'.
- translations contains all global UI copy; gameTranslations contains localized game descriptions, tags, and features.
- getInitialLanguage reads ?lang=ar or ?lang=en first, then localStorage key yahyaz-language, then defaults to English.
- Current behavior intentionally sets document.documentElement.dir = 'ltr' for both languages.
- Reason: the user requested Arabic text while keeping the website structure left-to-right. Do not reintroduce full RTL mirroring unless the user explicitly asks.
- The Arabic wrapper class app-shell-rtl remains, but it should not mirror the hero/grid/header geometry. Keep logo object-position and transform stable.
- PowerShell may show Arabic source strings as mojibake. Use a UTF-8-aware editor and check the browser rather than trusting terminal display.

7. Important Fixes Already Completed

- GitHub push error from public/assets/videos/puzzle-vs-zombie-promo.mp4 over 100 MB was fixed by compressing the video under 100 MB while keeping the same path and filename.
- Favicon missing issue was fixed by creating public/favicon.ico and referencing it in index.html.
- Hero white text was replaced with the supplied Yahyaz Lab transparent logo and styled to look more 3D.
- Images were converted/compressed to WebP where appropriate and source references were updated.
- Since 2021 badge was added to the hero and studio identity areas.
- Contact email admin@yahyazlab.com was added to the contact CTA.
- Arabic language switcher was added and then adjusted so Arabic mode keeps left-to-right layout and no longer cuts the logo.

8. Design Rules To Preserve

- Keep the site as a polished portfolio, not a generic landing page. Real gameplay media should remain prominent.
- Do not replace the logo with plain text in the hero. The transparent Yahyaz Lab artwork is the visual centerpiece.
- Keep cards at 8px border radius or less to match the current design language.

- Avoid introducing heavy decorative gradients or unrelated stock imagery. Use the supplied game media.
- Keep mobile readability high: header wraps, hero starts lower, logo is centered and constrained, buttons become full width.
- Use lucide-react icons when adding new UI controls.
- Respect prefers-reduced-motion. Heavy animations should be disabled or dramatically reduced.
- Keep video preload lightweight unless the user prioritizes immediate video playback over page speed.

9. Known Gaps And Suggested Next Work

- Store buttons are placeholders because real store URLs were not provided.
- Arabic content exists in App.tsx, but verify all Arabic strings in a UTF-8 editor and browser after any edits.
- The site has no automated browser test suite. Current verification has been manual build and screenshot smoke checks.
- White Ninja video is still about 49.6 MB. It is safe for GitHub but could be compressed further for faster first visits if quality remains acceptable.
- The project has no SEO/social preview image metadata beyond the basic description. Add Open Graph/Twitter metadata when deployment URL and preferred image are known.
- No contact form exists, only mailto. Add a real form only when backend/service target is known.
- Accessibility could be improved further with focus trapping in the modal and more detailed text alternatives for screenshot galleries.

10. Verification Checklist For Future ChatGPT

- Run `npm.cmd run build` before delivering any code change.
- Test English and Arabic using `http://127.0.0.1:5173/?lang=en` and `http://127.0.0.1:5173/?lang=ar`.
- Check desktop around 1920x1080 and mobile around 390x844.
- Confirm the hero logo is not clipped in either language.
- Confirm videos show posters and do not block first render.
- Confirm modal opens, closes with Escape, and gallery arrows work.
- Check `public/assets/videos` files remain below GitHub's 100 MB file limit before pushing.
- Run `git status --short` before staging to avoid committing smoke screenshots or unrelated generated files.

11. Git And Deployment Notes

- Remote origin is `https://github.com/CryptoWolf77/Yahyaz-Lab-Website.git`.
- Current branch is `main` and tracks origin/main.
- The last known commit at handoff time is `d6d4903` Optimize website images.
- If staging/committing/pushing from Codex, those git operations may need escalated permissions because Git writes index and ref locks.
- Do not use destructive git commands like `git reset --hard` unless the user explicitly requests them.
- Do not commit `dist/` or `node_modules`. They should stay ignored.

12. Quick Prompt For The New Chat

Suggested opening message to paste with this PDF:

I am continuing development of the Yahyaz Lab Website project. Please read the attached PDF handoff first. The local project is a Vite React TypeScript single-page portfolio at C:\Users\ThaherTech\Documents\New project 3. Keep the design direction, Arabic left-to-right layout behavior, optimized assets, and existing file structure unless I ask for changes.
